

Understanding Terraform Workflow

From Code to Cloud Infrastructure

The Six-Step Journey

Terraform transforms infrastructure code into real cloud resources through six essential commands. Each step builds upon the last, creating a **reliable path from development to deployment**.

terraform init: The Foundation

BEFORE

AFTER

Every Terraform project begins with '**terraform init**' - downloading providers and preparing your workspace. This command sets up everything needed to manage your infrastructure.

fmt & validate: Code Quality Gates

```
terraform "generalizer" {
  name      = "antastan" {
    inds_name      = "terraform_nb_ure_bonic"
    resource_name = "terraform_fmt_nilo"
  }
}

terraform "tnavlit" {
  boot      = "tw_bracket" {
    target_name = "terraform_fmt_organlate"
  }
}
```

```
terraform "name veranton" {
  none      = "terraform"
  inde_name = "terraform_ab_ure_basic"
  resource_name = "terraform_validate"
}

terraform "formane" {
  boot      = "tw_validatt" {
    target_name = "terraform_fmt_organlate"
  }
}
```

Before touching real infrastructure, Terraform ensures your code is clean and correct. 'terraform fmt' organizes your code, while 'terraform validate' catches errors early.

terraform plan: The Crystal Ball

```
+ aws_instance.web_server[0] (🖨️ ↑)
+ aws_instance.web_server[1] (🖨️ ↑)
+ aws_s3_bucket.log_storage (📁 ↑)

~ aws_db_instance.main (🗄️ ~, changing size/config)
~ aws_security_group.allow_ssh (🛡️ ↻, showing rule change)

- aws_route53_record.old_endpoint (🚫 ✖)
- aws_eip.legacy_ip (🔗 ✖)
```

The execution plan shows exactly what Terraform will create, modify, or destroy. This preview prevents surprises and gives you **complete control over changes**.

apply & destroy: The Power Commands

terraform apply brings your infrastructure to life, creating real cloud resources. When it's time to clean up, 'terraform destroy' safely removes everything in reverse order.

Master the Lifecycle

Understanding Terraform's workflow means predictable, repeatable infrastructure management. Each command has a purpose, and together they create infrastructure as reliable as traditional software.
